L2+ Industrial Ring Managed Gigabit PoE+/++ Switch

ERPS Ethernet Ring Network Protection

ERPS supports multi-ring and multi-domain structures (master and sub rings) and optimizes the inspection mechanism in terms of two-way faults. In addition, it supports main device backups, load sharing and other work methods in <50ms switching.

This means that when multiple switches have been placed in a Ring and the network work is interrupted, it will recover within 50ms or less.

Working in Harsh Environment reliably

Wide Temperature Coverage
-40°C~+ 85°C

The Industrial switches with their solid IP40 housing can operate from -40°C ~ 85°C, and each POE port has 6KV surge protection. It is the ideal solution for applications which work under harsh environment. It suitable for network use in a heavy industry, factories, BANK or Automation critical applications and has an easy connection with the DIN35 Rail connection.

VLAN Dying Gasp QoS and more

The Industrial management switches are packed with many features, use the many VLAN functions to separate the traffic on your network, use Dying Gasp to get an alert when a remote connected device (CPE) is failing. Or use the QoS functions to stream your network in a smooth and non congested network these and many more

- High 90W PoE port can offer sufficient power to high power needed IPCAM, or PoE Led, thin clients, outdoor 4G or 5G CPE
- 30W PoE port can supply power for other PoE devices such as Access Points, normal IP Camera, outdoor wireless CPE
- Giving you much more flexibility on the usage

24/7 PoE Watch

PoE Watch dog (self-learning) technology and PoE Management

The Industrial PoE Switch will detect and provide full power to connected PD adaptively automatically. It features PoE Watchdog technology that can automatically detect connected PD and restart the crashed devices. When “PoE Watchdog” function is turned on, the switch auto-detects the front-end camera for 24/7. If there is no traffic output from the camera, it is judged that the camera is frozen, and the front-end camera is restarted through PoE power failure to solve the problem of camera crash.

2.5G or 1G Fiber Uplink

Fiber for Long Distance
Extend the network further
with SFP | SFP+ slots

Accomplished via a hot-pluggable 1G or 2.5G SFP transceiver which supports distance up to 300/500 meters over multimode fiber and 10KM to 80KM over single-mode fiber. (The distance depends on the optical module chosen). In harsh environments.

Functions	Advantages
ERPS	ERPS supports multi-ring and multi-domain structures (master and sub rings) and optimizes the inspection mechanism in terms of two-way faults. In addition, it supports main device backups, load sharing and other work methods in <50ms switching. This means that when multiple switches have been placed in a Ring and the network work is interrupted, it will recover within 50ms or less.
Ring Network	When a switch in the ring fails that other will keep the network path alive.
IGMP (Snooping)	IGMP snooping allows to constrain the multicast traffic. As the name implies, this is done by listening to IGMP traffic between the router and hosts. This means less unnecessary traffic.
DHCP Snooping	DHCP Snooping is to prevent unauthorized (rogue) DHCP servers offering IP address to DHCP clients, to prevent stranger router(s).
VLAN-Policy	Make a more secure network, divided the network traffic in separated groups. Give user groups access or limit their access in the network.
Port-aggregation	Increased bandwidth, when one physical connection is not enough, multiple can be combined together to form one large connection.
QoS	QoS can help to reduce network congestion by dropping or throttling low-priority traffic during periods of peak utilization and by using application-specific traffic routing to reduce congestion in critical sectors of the network.
Port Mirroring	Port Mirroring copies the message of specified switch port to a destination port. The copied is the Source Port, and the copying port is the Destination Port. Destination Port will make use of data inspection devices for the users to analyze the received messages to monitor and trouble control the network.
MAC Binding	This feature can protect your network from ARP poisoning attacks, in which hackers try to change the MAC address of their computers to match a real device on your network. To use MAC address binding, you must configure the interface to associate a client IP address with a MAC address
Bandwidth Control	This function is similar to QoS as it would help to control the bandwidth to the devices connected to the switch.
